OverSoft CPU Informer is a CPU information tool that displays a great amount of details concerning the computer processor in a very well-organized interface. In order to make everything as easy to read as possible, the program's GUI is based on a tabbed layout, with each tab providing access to a different type of information. The "Processor" screen for instance shows CPU name, platform, extended name, family, vendor string, features, cache and clocks, with a dedicated option to let you access details of each core. If you go for the "System" tab, you can see motherboard info, such as manufacturer, model and sensor model, but also memory details and timings. However, it's very important to mention that this particular feature doesn't work on 64-bit versions of Windows. OverSoft CPU Informer can show feature flags too, as well as cache and power management details, so it's pretty obvious that this isn't the kind of software aimed at beginners. In fact, the real problem is that OverSoft CPU Informer comes with no help section to aid its users, but given the fact that it shows generic information about the processor and the system, you can always search the Internet for more documentation. Of course, OverSoft CPU Informer is very friendly with hardware resources and works smoothly on all Windows iterations, without the need for administrator privileges. All things considered, OverSoft CPU Informer is a tool to try when it comes to CPU information. It provides plenty of details concerning the processor and interacts with its users via a very well thought out interface.
